

activity - 1

① food ordering system.

object oriented Paradigm.

↓
way of seeing and doing things.

oop: object oriented programming.

collection of objects with certain state & behaviour.

OOD: object oriented design.

Based on identification and organisation of objects.

OOM: object oriented Methodology.

Construction of Models.

OOD: object oriented modelling and design.

Modelling objects based on the Real world.

OBJECTS:

- complex datatype
- Has an identity.
- contains other datatype called attributes.
- Modules of code - operations or methods.

Date _____
Page _____

Attributes and associated values are hidden inside the object.

eg:

⇒ object - student.
⇒ Attributes: Name
Reg.No.
⇒ Methods: grade.

Encapsulation:-

Each object methods manage its own attributes is called as hiding.

(Obj A) learn about the values of attributes of another obj B.

eg:

class: Lady
Attributes: Age, salary.
Methods: get_age, set_salary.

CLASSES:

templates - have methods & attributes names and type information.
→ no actual values.

we design an application at the class level.
